

Data Mapping in Digital Health

As health care companies move into the digital health space, a proactive and strategic approach to data mapping is crucial to avoid legal and regulatory roadblocks. Answering these questions can help you take the first step on a successful journey into big data use.

1	What data do you need and for what purposes?	✓
2	How do you plan to use the data now and in the future?	✓
3	How will the data fit into your current tools?	✓
4	Where are you going to get the data?	✓
5	In what form will you get the data and from whom?	✓
6	Is the data from a reliable source?	✓
7	Does the source have the right to give the data to you and to allow you to use the data in the way you want?	✓
8	Who will access the data, how can you hold them accountable and how will they be trained on the data?	✓
9	What rights do you need to secure from the data source to allow you to use the data in the way you want?	✓

Look at your current use cases, as well as any future or secondary use cases that will enhance your business strategies.

McDermott Will & Emery can guide you along the way.
